

GAS CAPITAL PROJECT & CONTRACTOR PERFORMANCE ANALYTICS

Portfolio Project | Timothy J. Blanch | Fictional sample data | September 2026

PORTFOLIO	APPROVED VALUE	FORECAST	AT-RISK	AVG CHANGE ORDERS
40 Projects	\$42.4M	\$44.7M	4 Projects	9.8%

PURPOSE

Model how a contract-management analyst can turn project data into executive visibility on cost, schedule, contractor performance, financial controls, and exceptions.

WHAT I BUILT

A 40-project fictional gas-capital dataset, formula-driven Excel dashboard, contractor scorecard, management-attention queue, SQL portfolio queries, and a documented Power BI migration path.

DECISION LOGIC

Projects are surfaced for attention when cost variance, schedule delay, safety/quality indicators, or invoice-cycle performance exceed defined thresholds. The focus is exception-based management rather than reporting every metric equally.

SKILLS DEMONSTRATED

Excel analysis and dashboarding; KPI design; cost and forecast variance; contractor comparison; SQL SELECT / WHERE / GROUP BY / CASE / aggregates; stakeholder-oriented reporting; Power BI model preparation.

INTEGRITY NOTE

All project names, contractors, costs, locations, and performance results are fictional. No National Grid confidential or internal data is used.
